

THE NEXT GENERATION COLLAGEN STIMULATING SERUM TREATMENT.

Factor4 is a super-rich autologous preventative aging conditioning serum with four times more growth factors and cytokines.

A Factor4 treatment naturally stimulates your body's own collagen benefiting skin elasticity. This slows down the aging process, reducing fine lines and wrinkles, and reducing pores and scars. The result is a much brighter, healthier complexion, giving your skin a more youthful look, with even tone and texture.

Your body will naturally accept Factor4 because it contains a super-concentration of your own rich growth factors and cytokines.

Treatment is very simple.

NATURALLY YOUNGER SKIN.

The technology behind Factor4 is widely used around the world in regenerative medicine. With no additives at all, your serum is rich in your own anti-inflammatory protein cytokines.

FULL FACE	FRONT, SIDE AND BACK OF NECK
FINE LINES	SKIN BRIGHTENING
SAGGING SKIN	SKIN TIGHTENING
STRETCH MARKS	DARK EYE CIRCLES
CREPEY SKIN	BACK OF HANDS
UNDER EYES	FOREARMS
DÉCOLLETAGE	WRINKLY KNEES
SCARRING	COLLAGEN REGENERATION

NICE TO MEET YOU.

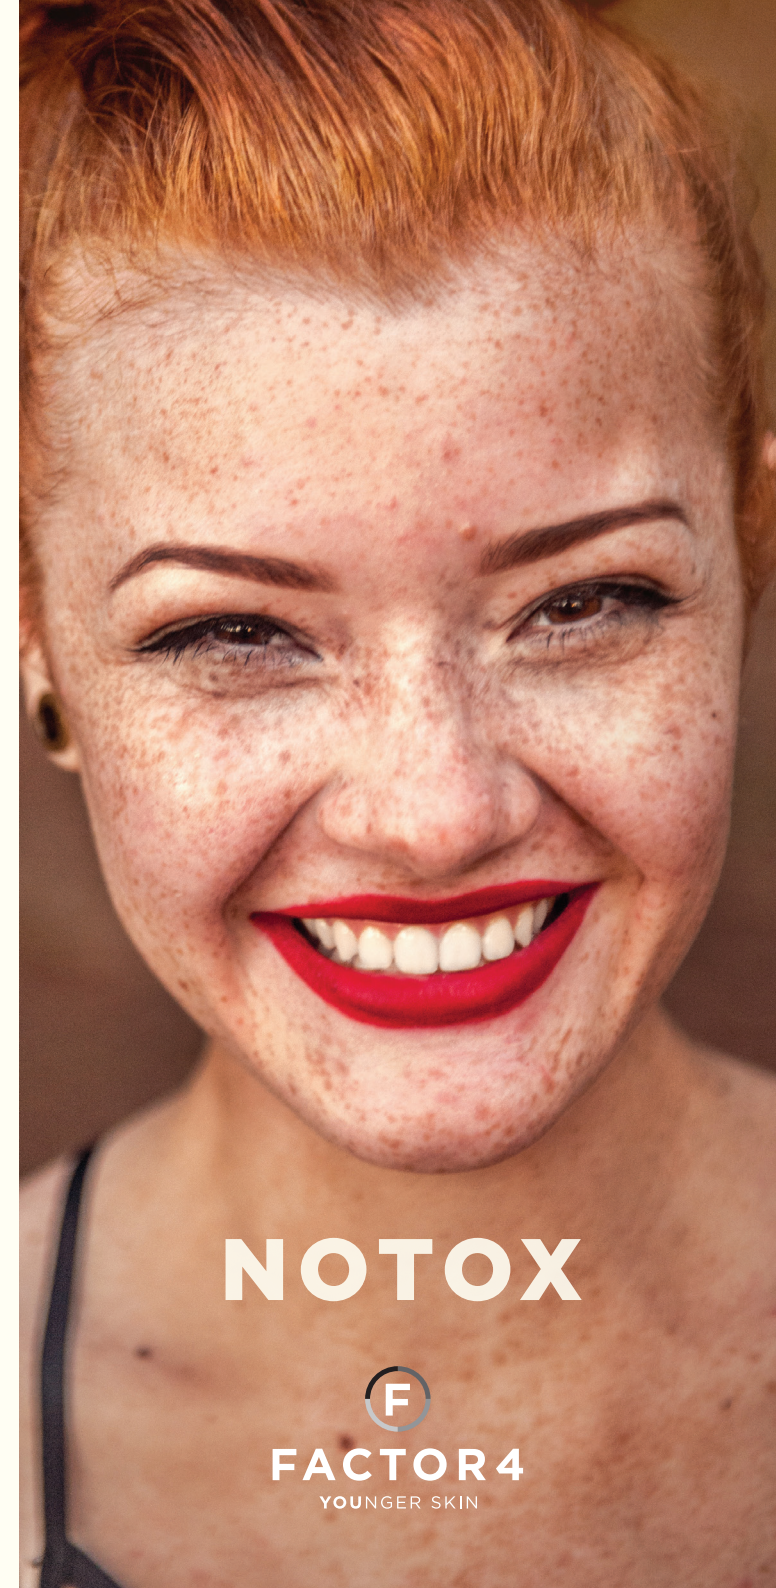

We are committed to saving the skin of men and women through reliable and proven technologies. We're constantly looking globally for ways to help our customers feel confident and fantastic about themselves.

FACTOR4
YOUNGER SKIN

TURN BACK TIME.

At 52, Frances is a busy mum and business owner. After Factor4 treatment she immediately noticed the smoothness of her skin. "Any lumps and bumps seemed to have vanished and open pores and old acne scarring looked less obvious" she said.

She was also surprised at her quick recovery; "The next morning I had very little redness and I covered up easily for work."

Frances Genovese
Factor4 Female Ambassador

HOW IS FACTOR4 PRODUCED?

Your blood is processed using patented technologically advanced tubing, producing your Factor4's highly concentrated serum. This 6-9 hour incubation process separates the cellular matter of your blood and extracts the super-concentrated rich growth factors and cytokines from your blood. The plasma concentrate is then spun and filtered to purify, making your serum four times richer.

Generally 8-10mls of serum will be collected, which can vary from patient to patient.

HOW MUCH BLOOD IS EXTRACTED?

Two x 10 ml vials. Your serum is portioned and frozen ready for your next appointments and used to treat your areas of concern.

HOW DO I PREPARE FOR BLOOD EXTRACTION?

Reduce or avoid alcohol consumption the night before as this can dehydrate you and increase the risk of bruising. Consume between two to four litres of water in the 24 hours prior. The more hydrated you are beforehand, the more serum produced.

IS FACTOR4 MIXED WITH ANYTHING ELSE?

No. It is not diluted with any other liquid and is a truly autologous system (obtained from the same individual) making it completely natural and extremely rich in growth factors and cytokines, allowing for the creation of new collagen structures.

HOW MUCH SERUM IS NEEDED TO TREAT AN AREA? CAN MORE THAN ONE AREA BE DONE IN THE ONE VISIT?

The face is one area and the neck/chest can either be one or two areas depending on the surface area.

A good guide is four treatments of 2.5mls = 10mls which is generally required for one area, however this can vary from patient to patient.

It is best practice to only treat one area at a time.

HOW DO I PREPARE FOR THE TREATMENT?

Simply arrive early to allow for a topical anesthetic cream application to the treatment area.

HOW IS FACTOR4 ADMINISTERED?

A Factor4 treatment can be administered using a skin needling device such as the MDerma pen or by injection into the dermal layers of the skin, over a course of four treatments, every 5-10 days. Depending on your practitioner's preference, other applications range from blebs, threads, direct injection, cannula and drizzle techniques.

Treatments usually last up to one hour and top up treatments are recommended every 6-12 months for optimum results.

IS IT PAINFUL?

A topical anesthetic cream is always used to ensure comfort.

ARE THERE ANY SIDE EFFECTS?

Skin redness can persist for up to 24-48 hours and occasionally this may last two days. You may also experience mild bruising or swelling around your eyes and lips.

WHAT IS THE RECOMMENDED POST CARE?

Please ensure you drink plenty of water and do not wash your skin for twelve hours. Moisturise your skin 3-5 times a day for 3-5 days. You may experience drier skin in the following days which is completely normal.

Once the redness has completely dissipated, you can resume your normal skin care regime, however we suggest you check with your practitioner, should you have any questions or concerns.

CAN I RETURN TO NORMAL ACTIVITIES AFTER A FACTOR4 TREATMENT?

It is strongly recommended to limit exercise and sweating to avoid the possibility of swelling and bruising for twelve hours.
